ABSTRACT OF THE FIVE-YEAR COMPREHENSIVE HEALTH PLAN

I. AUTHORITY AND PURPOSE:

Everywhere in the world there is a trend of increasing cost for all services. This is true for health care services, too. In the United States, the Congress passed Public Law 93-641 in 1975 in an effort to deal with the problem of rising medical costs and equal availability and accessibility of quality of medical care to all segments of the population. This Law requires all States of the Union to develop comprehensive health plans which must be approved by appointed authorities in the States in order for each State to be eligible to receive funds from the Department of Health, Education and Welfare. Under this Law, a State Health Coordinating Council has the legal mandate to revise and approve the State Health Plans. The Law also designated the Trust Territory of the Pacific Islands as a "State" under the same requirements. The responsibility of the development of the Territorial Health Plan was entrusted by the High Commissioner to the Department of Health Services, which in turn designated the Office of Health Planning within the Department to be responsible for the development of the Health Plan. In the effort to make the Territorial Plan more responsive to the needs of the different Districts, the Office of Health Planning decided to first develop a Health Plan for each District and then to use each District Plan as a basis for the development of the Territorial Plan. Under this Law, the Micronesia Health Coordinating Council, with members from each District, was formed to be the legal authority responsible for the revision and approval of the Plan. Marshallese members of the Council

5009162

are: Dr. Ezra Riklon, Mr. Jiba Kabua, and Mr. Caleb Rantak.

II. METHODS AND APPROACH:

Development of the Marshalls District Health Plan was started in August, 1977. A team of planners from Saipan came to Majuro and Ebeye to gather information and material that would be used in the development of the Plan. The District Director of Health Services and his staff provided all needed help in this process by providing needed material, equipment, and manpower for the various tasks. Members of the Marshall District Health Coordinating Council also actively participated in the formulation of questionnaires used in a Consumer Survey as well as participating in conducting the Survey itself.

Input data and information came from three main sources:

1. The Health Service System Itself: The planners gathered data and information from the hospital and dispensaries that would help them describe and assess the present situation of the health system's facilities, services, and manpower. Assessment of the system included assessment of the Administration, Medical Care Delivery, Nursing Care Delivery, Dispensary Operations, operation of all support services at the hospital, and all other health services programs now existing within the health services system.

2. Other Departments with Health-Related Programs and Interests:

Input for this segment of the Health Plan came from the Departments of Education, Public Safety, Public Affairs, and Vocational Rehabilitation,

as well as the Office of District Planning and the Budget office within the District Administration. Selected Community Leaders also gave input in this Section. The health planners interviewed respective Department heads to get their ideas about the existing situations in health services and also their ideas about how the system might be improved in order to improve the health status of the population of the Marshalls.

3. Community: A survey of consumer attitudes of the delivery of health care in the Marshalls was administered during the first field visit. The total number of respondents was 33. All respondents were women and had no vocational relationships with the Marshalls Department of Health Services.

A questionnaire was developed by the field team and translated into the Marshallese language. The questionnaire was composed of eight questions and identification of the respondent was not required. The respondents resided in four villages on Majuro and Ebeye.

The Saipan team of health planners were in the Marshalls for this data gathering phase for a total of three weeks. All of the information and data gathered during this phase were analyzed in Saipan and formed the basis of the Marshalls Health Plan which was written November, 1977.

III. THE PLAN:

Analysis of health information gathered in the assessment of the health system in the Marshalls District revealed the following prevalent conditions:

1. Health Status:

- a) The Marshalls has an extremely high birth rate in comparison to the Trust Territory. The population will increase 50% every four years.
- b) It would appear the major causes of morbidity (illness) in the Marshall District are skin, respiratory and gastrointestinal related conditions. This holds true for Majuro, Ebeye, and the Outer Islands alike.
- c) It would appear the major chronic illness in the Marshall District are asthma, diabetes, and hypertension.
- d) Causes of death closely parallel those of the United States with the long term, non-communicable diseases of the heart and cerebro-vascular systems and cancer being responsible for 40% of the deaths from 1974 to 1976. At the same time however, prematurity and conditions associated with delivery are significant causes of death.
- e) Neonatal deaths would appear to be a far more significant problem in the urban centers of the District than in the Outer Islands while infant and child death rates are approximately equal across all geographic areas.
- f) Prematurity (the second leading cause of death 1974-1976) is much higher in Ebeye than in either Majuro or the Outer Islands although the rate in Majuro (at 53.9 incidence per 1,000 live births) is far greater than in the Outer Islands (at 10.2 incidence per 1,000 live births).

5009165

Rates of pregnancy/delivery complications in the Outer Islands (except for hyperemesis and prolonged labor) are far lower than in the other two locations.

g) Immunization levels are low throughout Marshall District. Therefore there is a large population at risk in case of communicable disease outbreaks.

2. Health Services: In general, providers and the general public consider the providers of medical care to be well trained and capable of delivering quality health care. The exception to this is that practically all dispensary users were dissatisfied with the present level of skills of the Health Assistants.

Most consumers of health care expressed dissatisfaction with the use of Medex in the delivery of health care at the hospital.

The majority of problems expressed by the consumers of health care regarding the health system have to do with the administration:

- Lack of availability of physicians at the hospital during weekends, nights, etc.
- Lack of controls to assure delivery of quality medical care, such as the performing of physical examinations before prescribing medications.

Other problems of health care have to do with public expectations of the level of professionalism and diligence from the health providers. The consumers often complained about the unfriendliness and lack of courtesy of certain nurses; physicians taking time for coffee breaks while

patients wait, etc.

Consumers of health care also complained about the inadequacy of activities or controls directed in assuring the cleanliness of the environment (increased number of junked cars, rodents, litter in the environment, as well as the infrequency of sanitation team visits, etc.).

3. Consumers of Health: Certain problems were also identified with the consumers of health care:

- Foremost is a lack of understanding on health related issues.
- There is also a certain level of expectations of services that are not aligned with economic realities, such as expectation of services at no cost or minimal cost, expectation of physician care at all times, etc.).

IV. GOALS AND OBJECTIVES:

Certain goals and objectives have been developed based on the problems identified with respect to the health status of the population and the administration of the health services system as well as the level of consumers' understanding and participation in the improvement of the health status of the total population of the Marshalls.

The summary of these goals and objectives follows:

Goal #1: To increase support of and to concert efforts on the activities and services that are directed towards the prevention of diseases. This goal summarizes the goals and objectives for Public Health, Environmental

Health, Health Education, Nutrition Services, and Mental Health Divisions of the Department of Health Services, as well as the goals and objectives for the Departments of Public Affairs, Public Works, Public Safety, and Education.

Goal #2: To improve the administration and supervision of health services to the extent that more effective and efficient medical care services could be delivered by the health system. This goal summarizes the goals and objectives set for Health Services Administration (including the Medical Staff), Nursing and Dental Health Divisions, as well as the Division of Public Health as it relates to the dispensary operations.

Goal #3: To raise the level of awareness and understanding of the public regarding health-related issues, to the extent that more individuals would involve themselves actively in improvement efforts of their own for their health and the health status of the community. Part of this goal is also directed towards raising the public awareness and understanding of the responsibility that the public has in affecting health policies. This would be done through proper channels such as the Municipal and District Government offices, the District Legislature and the Marshall Health Coordinating Council. This goal summarizes the goals and objectives set up for the Departments of Education and Public Affairs and the Divisions of Health Education, Nutrition, Mental Health, and Administration within the Health Services Department--as well as the goals and objectives for the Community leaders.

V. PHILOSOPHY IN DEVELOPMENT OF GOALS AND OBJECTIVES AND PRIORITY SETTING:

In the development of goals and objectives and in the setting of priorities for the Marshall District Five-Year Comprehensive Health Plan, the underlying two-fold philosophy adhered to was:

- To change the emphasis of health services from the curative to the preventive and to emphasize the goals and objectives which require minimal additional resources, including the use of expatriate consultants.

The purpose of this philosophy is to involve the general population to a much greater extent than before in the responsibility for their own health and to utilize local resources to the fullest extent. It is hoped that the use of available local resources would stimulate national pride and self respect. It is also an effort to minimize the drainage of monetary resources spent on outside consultants, many of whom--judging from past performance--have been largely ineffective.

(a repeat survey will be performed in 1978)

* The higher number of children having 844's (a permanent Public Health record file) than enumerated in the birth sample (56.4% higher) can be interpreted as one indication of the degree to which births in the Marshalls are unreported to TPI Dept. of Health Services, Division of Vital Statistics.
