MARINE LANDING AND BEACHING INFORMATION
FOR ALL SITES
ENIWETOK ATOLL

ALICE — LCMs and LCUs beach on sand bar through break in reef. Require plus 1.5 tide or under. Tracked equipment and vehicles only.

Channel Markings: None at present.

CLARA — LCMs beach on sand bar through break in reef. Require plus 1.5 tide or under. Tracked equipment and vehicles only.

Channel Markings: None at present.

GENE
HELEN
IRENE — Causeway out between HELEN and GENE. Landings for LCUs and LCMs on west side of GENE. LCMs can beach at IRENE but require a plus 2.5 tide. IRENE and HELEN connected by causeway. Old channel at GENE useable but not recommended.

Channel Markings: None.

JANET — LCMs and LCUs at any tide.

Facilities: Hard sand ramp. (Note: Freight pier in damaged condition, not recommended for use until repairs made.)

Channel Markings: None.

KATE — LCMs requirea plus 1.5 tide and LCUs require a plus 3.0 tide.

Facilities: Sandy beach landing.

Channel Markings: None.

LUCY — LCMs require a plus 1.5 tide and LCUs require a plus 3.0 tide.

Facilities: Sandy beach landing.

Channel Markings: None

~~OFFICIAL USE ONLY~~

MARINE LANDING AND BEACHING INFORMATION FOR ALL SITES (Cont'd)

MARY

LCMs can enter at any tide. LCUs require a plus 2.0 tide.

Facilities: Sandy beach landing.

Channel Markings: None.

NANCY
OLIVE
PEARL

LCT (Only) require a plus 2.0 tide.

Facilities: Sandy and coral beach landing.

Channel Markings: None.

RUBY
SALLY
TILDA
URSULA

Connected by causeway. Entrance channel at URSULA. LCMs and LCUs can enter at any tide.

Facilities: Freight pier and concrete ramp.

Channel Markings: One lighted entrance buoy (Fl.-W.) and eleven channel buoys. (Oil drums; 6 red and 5 black.)

Note: The channel to the causeway landing between TILDA and URSULA and the channel to the damaged pier at SALLY have sanded in and are not being used. (Some old channel marking buoys are still in place.)

WILMA

LCMs can enter at any tide. LCUs require a plus 2.0 tide.

Facilities: Sandy beach landing.

Channel Markings: None.

YVONNE

LCMs, LCUs, and YTLs (Tugs) can enter at any tide.

Facilities: Freight pier and [illegible] ramp.

Channel Markings: One lighted entrance buoy (Fl. W.).

~~OFFICIAL USE ONLY~~

~~OFFICIAL USE ONLY~~

MARINE LANDING AND BEACHING INFORMATION FOR ALL SITES (Cont'd)

ZONA — DUKW's only.

ALVIN
BRUCE
CLYDE — LCMs can enter at any tide. LCUs require a plus 2.0 tide.

Facilities: Sandy beach landing.

Channel Markings: None.

DAVID — LCMs, LCUs, and YTLs (Tugs) can enter at any tide.

Facilities: Freight pier and a sandy beach landing.

Channel Markings: None.

ELMER — LCMs, LCUs, and YTLs (Tugs) can enter at any tide.

Facilities: Freight pier, personnel pier and two concrete ramps.

Channel Markings: None.

FRED — LCMs, LCUs, and YTLs (Tugs) can enter at any tide.

Facilities: Freight pier, personnel pier, 40 feet concrete ramp by personnel pier and sand ramp by freight pier.

Channel Markings: One clearance buoy just off the personnel pier.

GLASS
HENRY
IRVIN
JAMES
KEITH — LCMs (Only) require a plus 2.0 tide.

Facilities: Rock coral beach landing. (Sandy in spots.)

Channel Markings: None. (Note: Not used very much.)

~~OFFICIAL USE ONLY~~

~~OFFICIAL USE ONLY~~

MARINE BEACHING AND LANDING INFORMATION FOR ALL SITES (Cont'd)

LAMOT

LCMs require a plus 2.0 tide and LCUs require a plus 4.0 tide.

Facilities: Sandy beach landing

Channel Markings: One large nun buoy (Red #2) and four other channel buoys (oil drums) (3 red and 1 black).

Note: Red nun buoy #2 serves also as a mooring buoy for LCMs. Keep all red buoy close to starboard when entering channel. Beaching area is between the last red buoy (#8) and only black buoy (#7).

OSCAR

LCMs (Only) at any tide.

Facilities: A ladder is at the southeast side of tower.

Channel Markings: None.

MACK

LCMs and LCUs at any tide.

Facilities: Landing platform is at the north side of tower base.

Channel Markings: None.

ENGINEERING CALCULATION SHEET

HOLMES & NARVER, INC.
ENGINEERS - CONSTRUCTORS

JOB NO. 942
SHEET 1 OF
BY ES DATE

TITLE HEIGHT OF TIDE AT ANY TIME

Obtain from the predictions the high water and low water, one of which is before and the other after the time for which the height is required. The difference between the times of occurrence of these tides is the duration of rise or fall, and the difference between their heights is the range of tide. Find the difference between the time of the nearest high or low and the time for which the height is required. (Cont'd at bottom of page)

Enter the table with the duration of rise or fall, which most nearly agrees with the actual value, and on that horizontal line find the time from the nearest high or low water which agrees most nearly with the corresponding actual diff. The correction sought is in the

TIDE TABLES

ENIWETOK ATOLL, MARSHALL ISLANDS

1957

This tabulation is extracted from "Tide Tables, Central and Western Pacific Ocean and Indian Ocean, 1957", and published by the U.S. Department of Commerce, Coast and Geodetic Survey.

Datum, elevation 0.0, is defined in the above publication as follows: "Heights are reckoned from the datum of soundings on the largest scale charts of the locality which is ½ foot below mean low water springs" for Kwajalein Atoll, Marshall Islands.

The reference station is Kwajalein Atoll, time meridian 180 degrees east. The following tabulation appears in Table 2. - Tidal Differences and ranges:

				Ranges	
	Lat	Long.	Time	Mean	Spring
Eniwetok Atoll	11° 21'	162° 21'	-05 min.	2.7'	3.9'

Range is the difference between successive tides, i.e., between a high and a low or a low and a high. Mean range is the average range of all tides in the year. Spring range is the average of the largest ranges in the year. Springs occur once each lunar month (approximately 28 days) when the highest highs and the lowest lows are recorded.

The values in this tabulation are based on average weather conditions. Unusual weather, particularly high winds from a direction other than seasonally normal, affect both the times and the heights.

Each site in the Atoll has a slightly different time and height of highs and lows. This can be disregarded for all practical purposes in the lagoon. The water level on the ocean reef is always higher than that of the lagoon, the difference varying from a few tenths to 1.5'.

BUILDING & STRUCTURE NUMBERS

HOLMES & NARVER, INC.

REVISED TO 1 OCT. 1956

MISC. 415

NOTE: Any corrections or changes to this list should be made only on the master list which is maintained in the Office Engineering & Design Department of the Engineering Division

~~OFFICIAL USE ONLY~~

54

GENERAL NOTES

1. For further information on sizes and types of buildings, refer to the As-Built Drawings.

*2. Column denoted by an asterisk contains numbers which represent General Layout Drawing Number or area on which building appears on the new 1" - 50' topographic sheets.

3. The building numbers in this index pertain to Holmes & Narver Plans, General Layouts and Survey notes.

4. Symbol beside building number (M) indicates Military owned building or structure.

5. Symbol beside building number (C) indicates A.E.C. owned building or structure that is capitalized, or, Construction-Work-Is-In-Progress.

BUILDING & STRUCTURE NUMBERS

HOLMES & NARVER, INC.

REVISED TO 1 OCT 1956

MISC. 416

NOTE: Any corrections or changes to this list should be made only on the master list which is maintained in the Office Engineering & Design Department of the Engineering Division.

~~OFFICIAL USE ONLY~~

GENERAL NOTES

1. For further information on sizes and types of buildings, refer to the As-built floor plans.

*2. Column denoted by an asterisk contains numbers which represent General Layout Drawing Number or area in which building appears on the new 1" = 200' topographic sheets.

3. The building numbers in this index correspond to Bolmar & Murray Plans, General Layout and Survey Index.

4. Symbol beside building number (M) indicates Military owned building or structure.

5. Symbol beside building (C) indicates Civil owned building or structure that is unfinished, e.g. (C) Building-Work-In-In-Progress.

BIKINI ATOLL, MARSHALL ISLANDS

1957

This [illegible] was [illegible] by the Pacific, Coastal and Geodetic Pacific Ocean, and Tarawa Quad, 1957, and plotted by the U.S. Department of Commerce, Coast and Geodetic Survey.

Datum, or zero of depths, is defined by the chart sold reading as follows: "Heights are referred to the datum of soundings, the lowest tide observed of the normally semi-diurnal tide below mean sea level. See explanation for Bikini Atoll, Marshall Islands."

The meridian is oriented to Geographic North, the declination 180 degrees east. The following information appears in the chart title: Tidal differences and ranges:

	Lat.	Long.	Time	Ranges	
				Mean	Great
Bikini Atoll	[illegible]	[illegible]	[illegible]	3.4'	4.5'

Range is the difference between successive ebbs, low, between a high and a low or a low and a high. Mean range is the average range of all tides in the year. Spring tides are the two days each month (approximately 14 days) when the high and low tides are greatest.

The values in this publication are based on average weather conditions. Unusual weather, particularly high winds from a direction other than normal, affect both the times and the heights.

Each side of the chart has a system of figures for time and heights of high and low. This is interpreted for the particular purpose in the legend. The water level on the reference plane is always less than most of the tides, the difference varying from [illegible] for [illegible].

Specifications for Surveys

The basis of classification of geodetic control surveys is the accuracy with which the length and azimuth of a line can be determined. Since it is impossible to ascertain the absolute error, it is assumed that the procedure in executing the survey conforms to standards which have been established as the result of extensive experimentation and research. For this reason, the triangulation surveys of this department will conform to the specifications and methods of the U.S. Coast and Geodetic Survey.

Specifications are prepared for each class of the work and much other information of value is contained in Special Publication No. 247, Manual of Geodetic Triangulation published by the USCGS. This manual will be the textbook for precise surveys, and personnel involved in the work should familiarize themselves with the contents. The following is a summary of the procedure involved in making a survey, and is not intended to replace reference to the manual.

Generally, the degree of accuracy and the stations whose interrelation are required will be specified by the Client. The approximate locations of the triangulation stations will be determined based on reconnaissance and conformance to strength of figure requirements. Instructions including the above information will be issued to the field for execution of the work.

Reconnaissance. Before observing can be established, the stations must be physically established and, if necessary, observing towers erected. Intervisibility of stations must be determined, and the location and height of towers so established that the line of sight has a minimum vertical clearance of ten feet from any object. The minimum safe clearance both vertical and horizontal is dependent on atmospheric conditions, and reference to C.S. 247, Manual of Reconnaissance for Triangulation, is recommended for information on the subject. Formulas and a table for determining intervisibility will be found on Page 17, page [illegible]. The computed heights of towers to compensate for the earth's curvature and refraction plus ten feet will give the actual height of towers.

Reference. The following references are published by the U.S. Coast and Geodetic Survey, should be available in the field where precise triangulation is to be accomplished. The chapters on triangulation found in many textbooks are based on information from these circulars.

C.S. 247, Manual of Geodetic Triangulation
C.S. 248, Manual of Reconnaissance
C.S. 249, Manual of First Order Traverse
C.S. 215, Manual of Second Order Triangulation
C.S. 216, Manual of Intersection Location
C.S. 8, Formulas and Tables for the Computation of Geodetic Positions

C.S. 249 and 247 are supplemented by C.S. 247, but do contain more detail on some subjects.

INSTRUCTIONS FOR USE OF THE [illegible] THEODOLITE

(Issued by the U.S. Coast and Geodetic Survey)

These instructions are prepared for the Wild T-2 Theodolite, but contain information applicable to the Wild T-3.

1. Unpacking and setting up of the instrument. The case is set up with the felt to the rear, and the two lateral screws of the base plate are unscrewed. The hood is then carefully lifted and the two clamping levers are unloosed. The base plate which is fastened to the frame with a milled screw, is taken out and set on the stand, centered, the three levers are pulled out, the theodolite is set in and the tribrach screws are tightened with the clamping levers.

2. Leveling. [illegible] is not necessary anymore by leveling, since the point of support of the plane table is the plane which passes through the tips of the tribrach screws.

The theodolite should be turned several times about the vertical axis and the telescope transmitted before starting [illegible].

3. Focussing. The focussing of the eye piece is done by turning the black milled ring until the crosswires become very sharp and black, while the telescope is pointed on a moderately light background. A person should observe and remember the setting of the ring on the numbered scale, and then use this for future focussing. To focus on the image of the sighting point, turn the nickel focussing ring (testing for freedom of parallax between image and crosswires, by movement of the eyes). For the focussing of the reading microscope, the milled black ocular tube, at the side of the telescope is turned until the graduations of the circle become sharply defined.

By changing eye-pieces, a person may obtain the magnifications of 24, 30 or 40; normally, the magnifying of 30 should be used, and this eye-piece should also be used for the zenith prism.

4. Reading the circle. The horizontal and vertical circles are read in the microscope, adjoining the telescope. To the right, next to the slow motion screw for the vertical circle is the milled head screw for the inverting contrivance. By turning the screw clockwise until the stop, the horizontal circle becomes visible in the microscope, then by turning it counterclockwise the image of the vertical circle becomes visible.

The illumination of the circles should be as bright and as equally illuminated as possible. To do this, the illuminating prisms are turned. During the measurement of an angle, the illumination should not be changed. In the reading microscope appear the images of the diametrically opposite portions of the circle, separated by a fine horizontal line, and below and above the scale image of the second drum.

5. Horizontal circle and the signs. The horizontal circle is graduated to 4 minutes, and is read (after interpolation), by means of the index, to 2 minutes. The lower row of degree figures is read.

To this circle reading be added double the reading of the seconds drum, since the drum is half graduated. The drum is numbered by tenths from 0.0 to 60.0, but this represents intervals of 20 seconds, so that single drum reading is only half the true value and must be multiplied by two before being added to the circle reading. In practice two readings of the drum should be taken and the sum of the two used to the circle reading, thus accomplishing the same result as multiplying the drum reading by two and gaining the added accuracy of two micrometer readings instead of one. The following example will make this clear:

Circle reading		Seconds Drum		Total Reading			
°	'	1st read.	2nd read.	sum	°	'	"
104	58	6.8	6.9	13.7	104	58	13.7
119	10	11.1	10.0	21.1	119	11	22.1
140	20	19.8	20.0	39.8	140	20	39.8
158	30	32.0	31.3	63.3	158	31	06.3
172	52	7.0	7.0	14.0	172	52	14.0
0	12	17.9	17.8	35.7	0	13	35.7
43	28	39.0	39.1	78.1	43	29	18.1

Since only two micrometer readings are used instead of six as in 3-micrometer instruments, greater care and greater refinement of drum readings must be taken with the two readings. This is more readily possible with 2-micrometer theodolites.

The seconds drum reads directly to one-tenth seconds (0.2 seconds) and all readings should be taken to this degree of refinement, record the sum of the two readings, also the mean of direct and reverse readings and the direction to the nearest tenth of seconds.

Experience shows that the difference between two careful micrometer readings will seldom be greater than 0.3 double seconds (0.6 seconds) and generally no more than 0.1 double seconds (0.2 seconds). If the two readings vary by more than 0.3 double seconds, (0.6 seconds), they should be repeated until two concordant readings are obtained.

4. Vertical circle readings. There is a known tendency of the vertical circle, on the majority of theodolites, to read differently in the direct and reverse positions. Always check the vertical circle bubble before reading the circle. The following is an example of the readings:

Direct [illegible]

Reverse [illegible]

Difference (angle of depression) [illegible]

With vertical circle left

Vertical circle readings [illegible] Index [illegible] elevation. depression

With vertical circle right

Vertical circle readings [illegible] Index [illegible] elevation depression

Records. Forms are provided for each specific [illegible] recording the results of observing and computing. These records should be kept on transparencies in order that reproductions can be made of all records of the survey.

All computations which are required to complete these forms should be included in the records of the survey. They should be arranged in an orderly manner, and in sufficient detail that the computations can be checked at the Home Office. References should be made to field books, map projections data used in computing the survey.

7. Electrical Illumination. There are two systems of illumination:

(a) That for the horizontal circle.
(b) That for the vertical circle and cross-wires.

The record drum is illuminated by the light for whichever circle is being read. The horizontal circle lamp is the one which has three wires attached to it: The vertical circle lamp is the one which has two wires. Remove the horizontal and one vertical illumination prism cover. Then in the clips in the base plate of the instrument slide between them the electrical illumination devices.

The cross wires are illuminated by a piece of paper inside the telescope which intercepts part of the light which goes to the vertical circle. This prism has no adjustment.

A rheostat may be installed in the circuit for regulating the cross-wire illumination. Tests should be made to see if it should be installed between the battery and horizontal circle lamp or between the horizontal and vertical circle lamps. When the system of illumination has been finished, a permanent rheostat can be attached if necessary.

To switch off the circuits entirely, pull out one of the small pins at the end of one of the wires of the horizontal circle illuminating attachment.

A very important point is the illumination of the horizontal circle. A diffused light is essential, and this diffusion is not provided by the frosted bulbs, provided with the instrument, to the desirable degree. Bulbs should be painted white, or a piece of paper should be placed over the end of the lamp tube for the illumination of the horizontal circle to give the required diffusion. Permanent changes will be made when field engineers have given the problem their attention. In the meantime a tube of white paint and a bottle of shellac should be carried by field parties painting bulbs.

Flashlight bulbs for circle illumination of either 2.5 or 3.8 volts may be used. The latter will likely be found preferable. Number 6 dry cells will be found more reliable for illumination current than the batteries supplied in a case with some of the instruments. Some bulbs apparently have the wrong screw thread and size of base to fit into the sockets. Before leaving for the field select proper spare bulbs for emergency.

8. Other Points. When not in use keep the horizontal circle, every few nights close the circle to test conditions by closing on the bubble at the end of the half set.

Carry the theodolite upright when in the car; do not let the case rest on its side. The theodolite is designed to be used by the bottom only, and if it rests on its side any length of time will be taken on the upper part of the vertical axis, an undesirable condition.

Laboratory tests indicate that the accuracy of collimation drops considerably when the telescope is not exactly focused. It is therefore desirable to exactly focus the telescope on a star, after the cross wires are focused, and always use the telescope at that focus for precise work. After the exact focus is obtained put a scratch across the edge of the focusing sleeve and the adjacent part of the telescope tube, so that exact focus can be obtained at any time.

9. Description of the theodolite.

Effective aperture of the objective [illegible] (2 3/8 inches)
Magnification (3 eyepieces) [illegible] 23.4 and 38.5
Length of telescope [illegible] mm. (10 inches)
Sensitivity of plate level, [illegible] per division
Sensitivity of vertical circle level, [illegible] per 2 mm.
(The coincidence adjustment of the bubble [illegible] doubles the accuracy of centering.)
Magnification of reading microscope [illegible]
Diameter of horizontal circle [illegible] mm. (6 1/2 inches)
Diameter of vertical circle [illegible] mm. (5 1/4 inches)
Division of horizontal circle to [illegible]
Division of vertical circle to 2 double minutes.
(really 8 minutes)
Value of smallest division of [illegible] seconds, estimated (0.1 seconds, really 0.2 seconds
Vertical circle bubble adjustment acts in the direction of the horizontal wire.

Weight of instrument [illegible] 11.5 kg. (25.3 lbs.)
" " case [illegible] 5.9 kg. (12.9 lbs.)
" " tripod and accessories [illegible] 7.1 kg. (15.5 lbs.)
Resolving power (24X eyepiece) 24
" " (30X ") 30
" " (40X ") 34

10. Zenith prism. This prism is to be used for astronomic observations. The Zenith prism is a [illegible] of the [illegible] The 30 magnification eyepiece is to be used for it.

11. Packing the instrument. The levers of the base plate are released, the instrument is lifted out and set on the base plate of the packing box. In front on one of the supports of the tribrach screws is a nickel mark. A similar mark is on the front piece of the base plate, the instrument must be so set in, that these two marks correspond, then the clamps are closed. The telescope is turned over until the eyepiece almost touches the standards, the standards are turned in the horizontal direction in such a way that the eyepiece comes over the two marks. The clamping screws for the vertical circle and the horizontal circle are moderately tightened. The base plate with the levers pushed in is again attached to the standards or it may be left on the stand. After carefully closing the hood, the two screws for tightening the hood are tightened.

NOTE: Paragraphs 3 and 11 do not apply to the type of instrument now furnished with the T-3 theodolite owned by [illegible]

Specifications of the [illegible] require a set of sixteen positions to be observed for first order triangulation and six to twelve for second order. Recommendations of the local office of this organization are that for average conditions eight positions be observed for second order triangulation.

The initial settings of the circle for the eight and sixteen position sets are as follows. It is not necessary to set the circle nearer than about one-half minute to the setting given.

8 Position

(1)	D	0°	00'	10"
(2)	R	180	00	25
(3)	D	45	00	35
(4)	R	225	00	50
(5)	D	90	00	10
(6)	R	270	00	25
(7)	D	135	00	35
(8)	R	315	00	50

16 Position

(1)	D	0°	00'	10"	(9)	D	90°	00'	10"
(2)	R	180	00	25	(10)	R	270	00	25
(3)	D	45	00	35	(11)	D	135	00	35
(4)	R	225	00	50	(12)	R	315	00	50
(5)	D	22	30	10	(13)	D	112	30	10
(6)	R	202	30	25	(14)	R	292	30	25
(7)	D	67	30	35	(15)	D	157	30	35
(8)	R	247	30	50	(16)	R	337	30	50

After completion of the direct readings on the initial light, direct pointings and readings are made to lights clockwise or additional light of the schedule. Then the telescope is plunged and pointings and readings made on the lights in the reverse order to and including the initial light. This completes position number one. With the telescope remaining reversed, the circle is set for position two, and pointings on the initial and other lights are made in the same manner as for position one. This procedure is repeated until the required number of positions have been observed. The objective sometimes is not observed.

It frequently happens that one or more lights are not visible during all or part of the time that the observations are being made upon the other stations. Little time should be spent waiting for a light to rise. The position missed can be observed later, using the same settings as for the corresponding position of the first series, or some other main scheme of direct observations during the program.

Every effort should be made to complete initial pointings sets to all required stations while occupying a station, as a second occupation will generally mean another night's work if the preceding station is inaccessible.

Rejection of Observations

The greater part of the time involved in the observing program is in preparation to observe, transporting, setting up, adjusting lights, etc. Once ready to go, any refinement in observing which may help to decrease the probability of re-observing a station is well justified. A rigorous application of the rejection limits to observations, even though the observation rejected was just outside the limit, will result in a saving of time and effort.

The following is a summary of rejection rules as applied by the USC & GS, and may be found in more detail in C.& G.S. 247, pages 39, 40 and 41.

(1) Any measurement of a direction deviating by more than four seconds from the mean for first-order triangulation, and by more than five seconds for second order, must be rejected if not observed using the same position setting.

(2) In applying the rejection limit the value of a direction should be rounded off to the nearest tenth of a second, and the criterion applied to each observation to the tenth of a second.

(3) If any observations are so far from the approximate mean as to obviously exceed the limit, these should be rejected before taking the trial mean and thus possibly re-observed.

(4) No reading should be rejected if it is within the limit of retention unless rejected at the time of observation.

(5) A trial mean is taken, and using the rejection limit any observation (including the individual ones forming a position mean) which differs by more than the limit from the trial mean is rejected. The rejected positions are re-observed.

(6) After a trial mean is obtained using the rejection limit applied, none of the observations rejected should be again included even though the new mean would bring them within the limit of rejection.

(7) Using a new mean, the rejection limit is again applied. If any of these observations fall outside the rejection limit they are rejected, and new observations and new means taken until all accepted positions are within the limits of the rejection.

(8) If one reading of two or more observations falls without and one within the limit of rejection, do not use the mean even though it comes within the limit. Use instead only the reading within the limit and reject the other.

(9) If two readings fall without the limit, one being abnormally high and the other abnormally low, and the mean within the limit, both readings should be rejected.

(10) If two or more readings have been taken for a single position, the mean should be used if all readings are within the limit of retention.

(11) Occasionally conditions will be encountered which make it difficult to bring all readings within rejection limits. There will be no abnormal spread in direct and reverse readings, but the position mean will be well within the limit. If the number of rejections is averaging much in excess of ten percent of the entire number of observations, the rejection limit may be increased. Before this is done, an attempt should be made to determine the cause of the large range.

Record of Rejected Directions

The following Record of Rejected Directions contains the field record of observing an eight-position set to accord with specifications. It is followed by an "Abstract of Directions" which contains the position directions and the mean of the eight positions as to directions.

The process of establishing the mean direction of a position may be understood by a study of the records for position No. 4 as follows:

(a) The direct and reverse readings are recorded for each observed station.

(b) The initial and closing direct readings on the initial station are meaned.

(c) The mean reading on the initial station established by a and b is subtracted from the mean D and R for each successive observed station to establish the direction for that position.

A trial mean is established by deducting 20.0" from each of the directions for each of the eight positions by the use of assumed values in this case (see Abstract of Directions) 40.0" for station Baker and 60.0" for station Ivy.

With these trial means each position is checked for compliance with rejection limits. Two examples of rejection follow:

Position No. 4. The trial mean for direction Baker is 40.0". It is obvious that D/R is outside the five-second rejection limit.

The mean D/R for a direction of 40.0 is obtained by subtracting the difference between the direction and trial D/R for Baker at this position, or: 20.0 - (40.0 - 20.0) = 20.0.

It is then found that the direction 20.0 is within limits and that the nearest reading D/R to obtain the limits must be rejected. 21.4 is accepted for the mean D/R.

Position No. 7. The position direction of 45.0 is obviously outside the five-second rejection limit of 60.0. 60.0 - (60.0 - 45.0) = 50.0. The direct and reverse readings of 50.0" and 50.0" are both outside the limits so the position is rejected and is checked (see Abstract of the same page).

In the Abstract of Directions a line is drawn through the original direction for Position 4 of 40.0" and the new direction of 40.0" is entered. The new direction for Position 7 of 45.0 is entered in the same manner.

A new mean direction is established and a check is made of the positions to determine that the directions for all positions and all position means' d's are within the limits of this field work.

It will be found that the records are arranged approximately with most of the successive northern and eastern boundaries which are obviously outside limits. This parallels procedure there existed before establishing a tribal mean, and will result in a reading of obtuse angles. For instance, in the first direction of Unit 'A' (Unit 'A' is surveyed on the first line east of Baker) when a direction of 45 [illegible] was established for the line by a previous survey indicated.

Triangle Closure. [illegible] requirements for triangle closures are that the maximum error in closure of any triangle shall not exceed three seconds for first order, five for second, and ten for third order, and that the average triangle closure where triangulation is being extended by a network of figures shall not exceed one second for first order, three for second and five for third order. (See U. S. C. 247, page xvii.)

Abstract of Directions. An Abstract of Directions will be kept as a part of the observing procedure for each station, and will list the direction for each position, the sum and the mean direction. (U.S. C&GS, pp. 236, 240 to 250.)

List of Directions. The List of Directions will generally list only the mean directions from the initial station to each station. Where an eccentric instrument or light is involved the necessary reduction and corrected direction to the true station will be given. (U.S. C&GS, pages 250 to 257.)

Triangle Computations. The form for triangle computations is set up to record the computation of two triangles on one sheet. The newly used station is always numbered 4, and the other two are 1 and 2 in a clockwise order, with the line 1-2 as the known line. The procedure in computing the triangles is explained in U.S. C&GS, pages 258 to 262.

Spherical Excess. The spherical excess in a figure is not considered in computing a plane triangle, but the spherical angle which is required in computing the geographic position. The spherical angle is larger than the plane angle, and the correction should be computed as explained in U.S. C&GS, pages 262, 263 and 271.

Side Checks. In the computation of a quadrilateral there are always three lines which have two values in lieu of their lengths. One of the requirements of triangulation is that the difference between the two values for the logarithm of the length of a line be no greater than two times the logarithmic difference for one second of the smallest distance angle included in the computation of either value for first order triangulation, and twice the amount for second order.

These side checks are the first indication of the quality of the observed angles, as it is possible for the triangles of a quadrilateral to close within the prescribed limits and not meet the requirements of the side check. The side check condition should be established before the closing of a quadrilateral is considered complete, as re-observing may be necessary.

Side equation tests should be made when the closures are large in order to isolate the direction that is faulty. (See U.S. C&GS, pages 10, 153 to 171, and xvii.)

Geographic Positions. The geographic positions of the stations should be computed at the junction of each quadrilateral and at the terminus of the

previous computations. A description of the [illegible] is given in C.S. 8, Formulae and Tables for Computation of Geodetic Positions. The latitude functions listed therein are necessary in computing the positions. (See also C.S. 247, pages 175 to 179.)

Triangulation Adjustment. The procedures outlined to this point is normally considered as included in the observing and field (or jobsite) computing. Due to the limited extent of the schemes surveyed by this organization, it is generally considered that when the side conditions have been satisfied further adjustment is not practical. On surveys where a coordinate system will be established and it is desirable that the values of a station remain exactly the same, independent of the direction of computation through the net, an additional adjustment is applied.

This refinement results in slight changes in the values, and a full least square adjustment is not considered practical for a limited scheme. A modified adjustment which meets the requirements of small schemes is included in this set of instructions.

COORDINATE SOLUTION OF THE THREE-POINT PROBLEM

The following solution of the three-point problem is due to Mr. K. O. Pyrd, formerly Chief of the Mapping Section, Division of Surveys, of the Tennessee Valley Authority, Chattanooga, Tennessee.

In the figure are shown the three points whose known coordinates, indicated by the subscripts, and the point whose plane coordinates, X, Y, are to be determined. The first step is to shift the origin of coordinates to the point X_3, Y_3, obtaining:

$$X_3' = Y_3' = 0$$

$$X_1' = X_1 - X_3$$

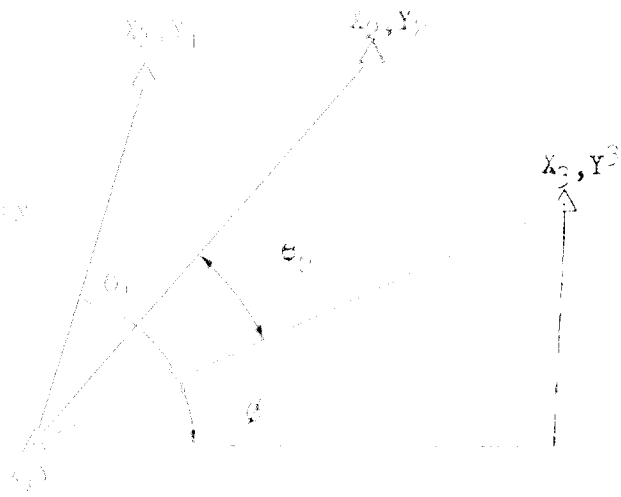
$$Y_1' = Y_1 - Y_3$$

$$X_2' = X_2 - X_3$$

$$Y_2' = Y_2 - Y_3$$

$$X' = X - X_3$$

$$Y' = Y - Y_3$$



From the figure, $\tan \phi'$ = Y' / X', and by trigonometry

$$\tan (\phi' + \theta_1) = \frac{\tan \phi' + \tan \theta_1}{1 - \tan \phi' \tan \theta_1}$$

$$\tan (\phi' + \theta_2) = \frac{\tan \phi' + \tan \theta_2}{1 - \tan \phi' \tan \theta_2}$$

or

$$\frac{Y_1' - Y'}{X_1' - X'} = \frac{\frac{Y'}{X'} + \frac{Y_1'}{X_1'}}{1 - \frac{Y'}{X'} \cdot \frac{Y_1'}{X_1'}} = \frac{X'Y_1' + X_1'Y'}{X'X_1' - Y'Y_1'}$$

and

$$\frac{Y_2' - Y'}{X_2' - X'} = \frac{\frac{Y'}{X'} + \frac{Y_2'}{X_2'}}{1 - \frac{Y'}{X'} \cdot \frac{Y_2'}{X_2'}} = \frac{X'Y_2' + X_2'Y'}{X'X_2' - Y'Y_2'}$$

where $\tan \theta_1 = m_1$ and $\tan \theta_2 = m_2$.

Clearing of fractions:

$$(Y_1' - Y')(X'X_1' - Y'Y_1') = (X_1' - X')(X'Y_1' + X_1'Y')$$

$$(Y_2' - Y')(X'X_2' - Y'Y_2') = (X_2' - X')(X'Y_2' + X_2'Y')$$

Performing the indicated multiplications:

$$X_1'Y_1'X' - m_1X_1'X'^2 - Y_1'^2Y' + m_1Y_1'X'Y' = X_1'Y_1'X' + X_1^2Y' - X'^2Y' - m_1X_1'X'Y'$$

Collecting terms and dividing the first equation by m_1, the second by m_2

$$(Y'^2 + X'^2) - X'(Y'_1 - A) - Y'(X'_1 + B) = 0 \quad \ldots\ldots\ldots\ldots\ldots (1)$$

$$(Y'^2 + X'^2) + X'(Y'_3 - C) - Y'(X'_3 + D) = 0$$

Setting the second factors of the second and third terms in the above equations equal to A, B, C and D, we have

$A = Y'_1 \cot \theta_1 - X'_1$; $B = Y'_1 \cot \theta_1$; $C = Y'_3 \cot \theta_2 - X'_3$; $D = Y'_3 + X'_3 \cot \theta_2$

Subtracting the second of the equations (1) from the first:

$$X'(A - C) - Y'(D - B) = 0$$

$$Y' = X'\frac{C - A}{D - B} = X'R \quad \text{where } R = \frac{C - A}{D - B}$$

Substituting this value of Y' into the first of the equations (1) we have

$$X'^2(R^2 + 1) + X'A - X'RB = 0 \text{ whence}$$

$$X' = \frac{BR - A}{1 + R^2}$$

And finally: $X = X' + X_1$; $Y = Y' + Y_1$

The quantity R furnishes a measure of the "strength" of the solution, the problem becoming indeterminate as R approaches the form 0/0. For example, if X'_1, Y'_1, X'_2, Y'_2 are of the order of several thousand feet, and C - A and D - B are of the order of 50 or 100 feet, the point X is close to the circle passing through the known points, and the solution is weak.

The only formal trigonometry involved in this solution is taking two cotangents from a table of natural functions. For some values of the angles, these functions might become very large, making the solution awkward. This difficulty can be avoided by so selecting the initial line as to keep these functions down to a reasonable figure generally less than 10.

R might in some cases come out very close to zero, or become practically infinite, should the point X, Y lie almost North or East of X_1, Y_1. However these difficulties seldom arise in practice. In several hundred three point solutions the writer has had to reject perhaps half a dozen fixes for weakness, and has never had to shift the initial line to get a finite value for R.

When a large number of three point determinations are to be made, it is well to solve them on a mimeographed form such as that on which the following problem is solved, which has been found highly satisfactory. The first step is to enter the coordinates of the known points in the appropriate places in the left part of the form. After the unknown coordinates have been found the coordinates X_p, Y_p are entered, and the solutions checked by inversing between X_p, Y_p and each of the known points. The difference in the azimuths of these lines should check the observed angles. Space is provided for the fourth point which should be observed whenever possible, both as a check on the fix as well as the method, and for possible use in the event that the solution based on the selected three points should prove to be weak.

The solution differs from the derivation above in that we solve first for Y instead of X. The solution can be greatly expedited by omitting those lines not marked (#) by carrying the work in the computing machine.

Terms and Conditions Apply

STATION	DISTANCE	AZIMUTH	SECTION	LATITUDE	DEPARTURE

Since the measured angles are spherical angles, each triangle will contain more than 180°, the amount greater than 180° is termed the spherical excess and about one second for each [illegible] square miles of area of triangle. More exactly, the total spherical excess [illegible] triangle is obtained by the formula (see Special Publication No. 6, p. 7)

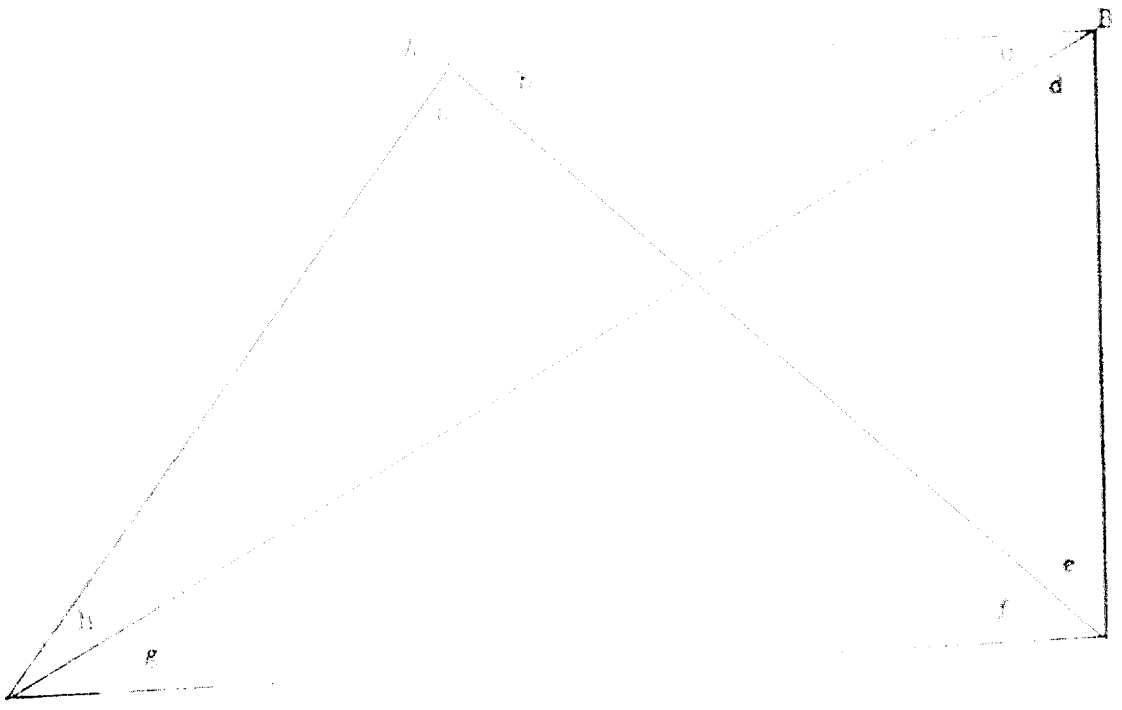
$$\epsilon = a_1 b_1 \sin C_1 \rho$$

where ϵ is the spherical excess, a_1 and b_1 are the two sides and the included angle, respectively, of the corresponding plane [illegible]. The letter letter m is used to designate that part of the expression which depends only on the latitude and the dimensions of the spheroid and the values of log m are given with the latitude as an argument in the table on page [illegible] of Special Publication No. 6.

It is clear that no correction for spherical excess will be necessary unless the triangles are very large, and then only for the most precise work. One third of the correction is [illegible] from each of the angles.

ADJUSTMENT OF A QUADRILATERAL

Before starting the adjustment of figures by [illegible] the computer should make a good clear sketch showing all the lines [illegible] which observations were made. The angles around each station of a quadrilateral are adjusted to total 360° before the figure adjustment is made. In the figure adjustment, two conditions are considered: (1) the geometric condition that the sum of the interior angles of a rectilinear figure is equal to (n - 2)180°, n being the number of sides of the figure; and (2) the trigonometric condition that in any triangle the sines of the angles are proportional to the lengths of the [illegible] opposite.



1. Geometric Conditions. When all the lines of a quadrilateral are measured, there are four overlapping triangles. These are those in triangles ABC, ACD, ABD, and BCD in the figure. In each of these triangles the sum of the three angles must be 180°. Hence from the figure,

$$b + c + h + e = 180° \quad (1)$$
$$a + f + g + h = 180° \quad (2)$$
$$a + b + c + d = 180° \quad (3)$$
$$d + e + f + g = 180° \quad (4)$$

Also the sum of the eight lettered angles in the figure must equal 360°, since they form the interior angles of a closed figure of four sides. This may be derived also by the addition of eqs. (1) and (2) or (3) and (4).

$$a + b + c + d + e + f + g + h = 360° \quad (5)$$

Further, since the opposite angles at the intersection of the diagonals must be equal, it follows that

$$b + c = f + g \quad (6)$$

$$d + e = a + h \quad (7)$$

Equation (6) is the equivalent of eq. (1) minus eq. (2) and eq. (7) is the equivalent of eq. (2) minus eq. (1).

If any three of these seven equations are satisfied, the other four must of necessity be satisfied also. Equations (5), (6), and (7) are the ones most convenient to use.

The following procedure is suggested for computation of ordinary precision:

A. Make the station adjustment as follows: Adjust the angles around each point to make their sum equal 360° by distributing the error equally (or approximately so) among the set of angles (not necessarily with non-repeating instrument).

B. Using the values resulting from the station adjustment A, add the eight angles a, b, c, d, e, f, g, and h, and subtract their sum from 360°. Divide the difference by 8, and increase slightly and the same by each of the eight angles, thus satisfying the conditions of eq. (5).

C. Using the adjusted values from B, find the difference between the sums (b + c) and (f + g) and divide this difference by four. Apply the result as a correction to each of the four angles, increasing each of the two whose sum is the smaller and decreasing each of the two whose sum is the larger, thus making these angles satisfy eq. (6) without disturbing the adjustment for eq. (5). Proceed in the same way with each of the four angles involved in eq. (7).

2. Trigonometric Conditions. If the length of one line, as BC, is known, and the length of the line AB is to be computed, the computer may select one or another series of triangles for use in accomplishing this result. For example, a solution of triangle ABC gives the length of AC, then from triangle ACE the required length of AE is found, and in the triangle AEF the length AF is found, then in ABF the length AB is computed. There are four possible chains

16

of route through the figure. It now remains to be seen whether the angle , or so far adjusted , can be altered to make the value of the length of a computed side independent of the route used. Assume that the length of AB is known and the length of AB is to be found.

$$\text{(illegible)} \tag{8}$$

Similarly,

$$\text{(illegible)} \tag{9}$$

Equating these two values of AB,

$$\text{(illegible)} \tag{10}$$

or

$$\text{(illegible)} \tag{11}$$

Expressed in logarithmic form, this is

$$\text{(illegible)} \tag{12}$$

The angles are varied by small amounts, as by applying $\pm 0.1''$, to approximate what the two groups are looking for and by finding the difference between the two sums.

Various adjustments by which this difference may be reduced to zero are possible. The least squares solution gives the most probable values to the adjusted angles, but it is unwieldy and more than is necessary for most surveys. A simple approximate method which gives a good correction for each angle and does not disturb the general condition is as follows (see adjustment of the following example):

(a) Record the log sines as shown in the example.

(b) For each angle, record the tabular logarithmic sine difference for 1" and write each in parentheses.

(c) Find the average algebraic change (d) in log sine by dividing the difference between the sums by 20.

(d) Find the average difference (e) for 1".

(e) For each angle, by proportion, find the number of seconds of correction to be applied as a correction to each angle.

(c) Add this correction to each of the observed log sines of the angles, and subtract it from each of the observed log sines of the angles, and find the corrected values thus obtained.

If one or more of the angles be greater than 90°, adjustment is to be made as just described, with the exception that the corrections are to be applied to the sine of an obtuse angle instead of the angle itself. However, since the sine of an obtuse angle decreases as the angle increases, the corresponding log sines will be changed in the direction opposite to that indicated. Usually the error introduced by that condition will be negligible for this approximate adjustment; if not, adjustment should be made as follows:

Example: Given the angles as measured in the quadrilateral (see figure), for which the station adjustment (each angle 1") has been made (see second column of following table), find the adjusted angles for both the geometric and the trigonometric conditions.

Angle	Station adjustment	Figure adjustment		
		Geometric condition		Trigonometric condition
	Adjustment a	Adjustment b	Adjustment c	Adjustment d
a	94-05-59.3	59.7	0.4	58.8
b	48-03-01.4	01.0	01.6	01.3
c	20-47-32.0	32.3	33.0	34.2
d	67-43-51.2	51.5	52.1	50.7
e	50-08-49.0	49.2	49.4	50.7
f	43-04-01.4	01.7	02.1	01.8
g	87-06-13.7	14.0	14.4	15.7
h	49-01-44.9	45.2	45.0	43.7
Sum	540-00-57.5	360-00-00.0	360-00-00.0	360-00-00.0

Adjustment a. The sum of the angles is 3" too large, resulting from the station adjustment, and is found to differ from 360° by the amount of 2.5". This amount divided by the number of angles gives the amount to be applied (0.3" + 1") to be added to each angle as shown in the 2nd column in the table.

Adjustment 2 [illegible]

Dividing this difference by 8, the correction to each angle is found to be 1.5", to be subtracted from the angles in column 3 and added to the angles in column 4. In like manner, the correction to the sides is found to be 0.2", which is added to sides [illegible] and subtracted from [illegible]. These computations are carried out only to the nearest 0.1". The results are shown in the fourth column of the table.

Adjustment 3. In order to fulfill condition (3), the logarithmic sines of the angles as given by adjustment 2 are to be [illegible] in equation (32) are recorded as shown in the following tabulations, and the tabular difference for 1" is recorded for each angle.

		Difference for 1"
log sin 1	9.9293872	3.0
log sin 2	9.9600103	55.6
log sin 4	9.8870993	17.6
log sin 5	9.4434966	80.5
	9.2199934	
log sin 3	9.9216033	18.9
log sin 6	9.2464763	33.9
log sin 7	9.6538419	22.9
log sin 8	9.4418477	68.9
	9.2657732	
	9.2199934	457.7
	0.0457798	29.7
	7.8	

The difference between the two sums is 68 units of the seven places of logarithms used. This value, divided by 8, gives the average required change in log sine, 7.8 [illegible]. The average tabular difference for 1" is 29.7 [illegible].

Hence $\frac{d}{s} = \frac{1.5}{29.7}$ [illegible], which is the average correction to be applied to each angle. Obviously, it will be added to angles 3, 6, 7, and 8, and subtracted from angles 1, 2, 4, and 5.

Since this adjustment is applied with opposite signs to alternate angles, it does not disturb the preceding condition. The final adjustment is given in the fifth column of the foregoing table.

If the triangulation system consists of a chain of quadrilaterals, each quadrilateral is adjusted in the manner just described. The computation for [illegible] of the central line, and then carries through the chain from the base line

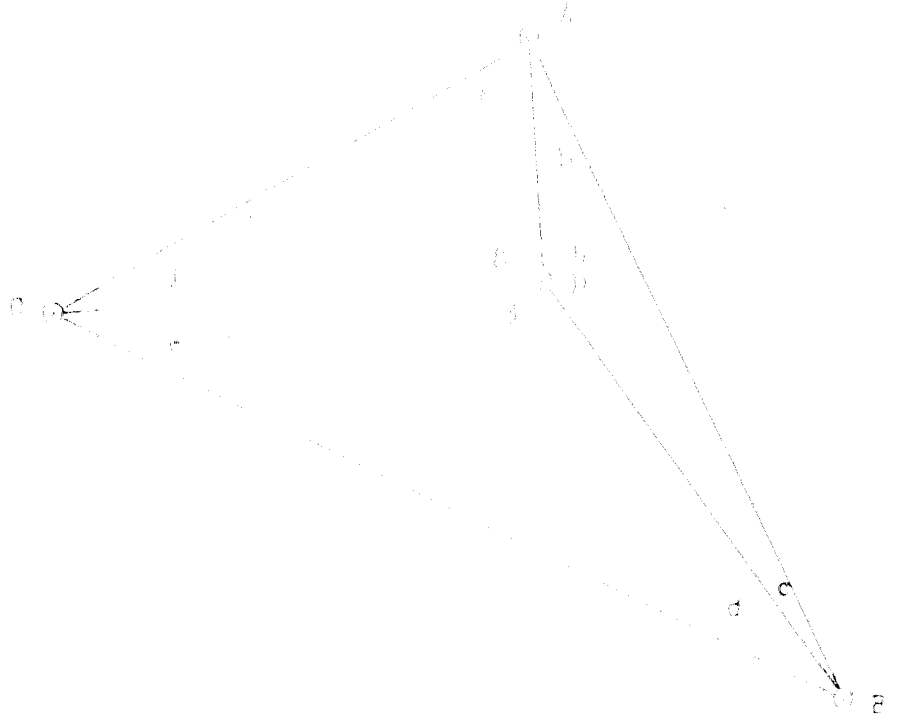
1-3				9402.64	3.9732500
1-2				7773.53	3.8906178

As in the case of the quadrilateral, the angles around each station of a central point figure are adjusted to total 360° before the figure adjustment is made. In the figure adjustment of the quadrilateral, two conditions are considered: (1) the geometric condition, and (2) the trigonometric condition.



1. Geometric Condition. It must be true of a central point figure the sum of the three angles will be 180°. Refer to the figure,

$$a + 1 + c = 180° \quad (1)$$
$$b + 2 + d = 180° \quad (2)$$
$$e + 3 + f = 180° \quad (3)$$

Also the sum of the (n-2) (in this case 4) angles forming the closed figure must total (n-2)180° where n is the number of sides of the figure (in this case 180°)

$$1 + b + 2 + e + 3 + c + d + f = 360° \quad (4)$$

Also the sum of the angles around the central point must equal 360°.

$$a + b + c = 360° \quad (5)$$

The following procedure is suggested for computation of moderate precision:

A. Make the station adjustment as follows: Adjust the angles about each point to make their sum equal 360° by distributing the error equally (or approximately so) to all of the observed angles.

B. Using the values resulting from the station adjustment A, add the three angles of each triangle and subtract 180° to find the [illegible]. Distribute the difference among the three angles (not by thirds but 180°, keeping in mind that the sum of the angles around the central point must remain 360°. This will necessitate correcting the angles at the central point by an unequal amount from those forming the other figures. This satisfies Eqs. (1), (2), (3) and (5). Eq. (4) is satisfied later [illegible].

2. Trigonometric adjustment. There are two possible choices of route through the figure. It is desirable to see whether the angles, as so far adjusted, are sufficient to make the values of the length of a computed side independent of the route used. In deriving, as is done in the quadrilateral adjustment, place the following equation:

$$\frac{\sin \quad \sin \quad \sin}{\sin \quad \sin \quad \sin} = 1 \qquad (6)$$

The angles are tested for sensibility of this equation by taking the logarithmic sines, as in the procedure for adjustment of a quadrilateral. The approximate method by computing each angle equally [illegible] suggested for the quadrilateral may be used for the central point figure.

Example: Given the angles as observed in the central point figure (see fig.) for which the station adjustment (adjustment A) has been made (see second column of following table). Find the adjusted angles for both the geometric and the trigonometric conditions.

Angle	Station Adjusted	Figure Adjusted	
		Geometric Condition	Trigonometric Condition
	Adjustment A	Adjustment B	Adjustment C
a	44° - 02' - 32.07	45° - 04' - 32.07	45° - 02' - 32.07
b	21° - 00' - 45.29	21° - 00' - 45.29	21° - 00' - 45.29
c	04° - 16' - 31.56	04° - 16' - 45.64	04° - 16' - 14.83
d	28° - 32' - 04.36	28° - 32' - 04.36	28° - 32' - 04.29
e	30° - 28' - 30.00	30° - 28' - 30.07	30° - 28' - 30.43
f	25° - 37' - 53.72	25° - 37' - 53.65	25° - 37' - 53.12
Sum	180° - 00' - 00.00	180° - 00' - 00.00	180° - 00' - 00.00
g	89° - 17' - 34.00	89° - 17' - 34.00	
h	148° - 45' - 00.00	148° - 45' - 00.00	
i	122° - 58' - 26.00	122° - 58' - 26.00	
Sum	360° - 00' - 00.00	360° - 00' - 00.00	

Adjustment B. Geometric condition: The sum of the angles in each of the three triangles are:

$$\text{(1)} \quad a + b + c + d + e + f = 180° - 00' - 00.00$$
$$\text{(2)} \quad g + h + i = 180° - 00' - 00.00$$
$$\text{(3)} \quad a + b + c + g + h + i = 180° - 00' - 00.00$$

In triangle ABD the sum of angles a and b was 180° by +0.04", 12 an equal correction was applied to each angle, the correction would be -0.02". Similarly, in triangle BDC and DBA the angle correction would be +0.33" and -0.16", applying this last correction to angles a and b, they is found to differ from 360° by 0.29". By doing this the correction to angle a b and i by 0.10" and found that the correction to angle c by 0.05" is satisfied. The remaining discrepancy of 0.02" is distributed equally between the other ten angles of each triangle, thus satisfying eqs. (1), (2) and (3).

Adjustment of Trigonometric Conditions. The logarithmic sines of the angles as given by [illegible] are tabulated below, and the tabular differences for 1" are recorded for each angle.

		Difference for 1"
Log sin a	9.8575435	9.8
Log sin c	9.2077994	13.0
Log sin e	9.7851490	9.2
	9.8504919	
Log sin b	9.9647766	4.6
Log sin d	9.8709439	9.1
Log sin f	9.6360662	4.4
	9.8239867	17.7
	9.8504919	
	-54	

The difference between the two sums is 54 units of the seven places of logarithms used. The latter, divided by 17.7, gives the average required change in log sine, 3.0 units. The average tabular difference for 1" is 52.0 = β. Hence

$$\frac{\alpha}{\beta} = \frac{9.0}{52.0} = 0.17 \text{ (nearly)},$$

which is the average correction to be applied to each angle. Obviously, it will be added to angles b, d, f, and subtracted from angles a, c, e.

Since this adjustment is applied both to the sines of alternate angles, it does not disturb the trigonometric conditions. The final adjustment is given in the fourth column of the foregoing table.

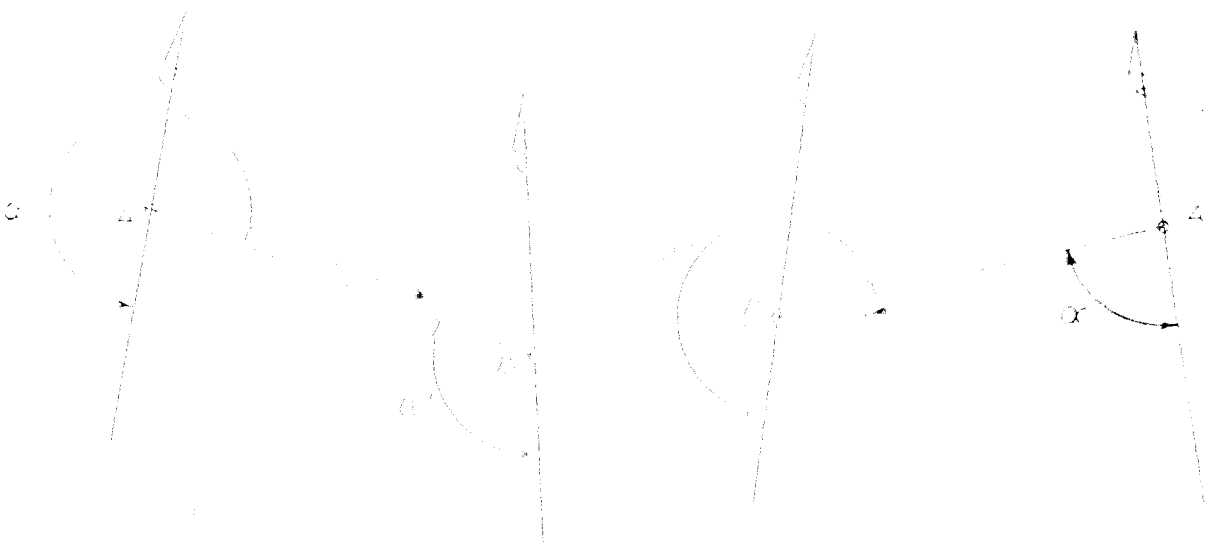


Fig. 1 Fig. 2

Notes: All west longitudes are taken as plus.

1. Find the difference of longitude (Δλ) between the two places by subtracting the smaller longitude from the larger.

2. If Δλ is greater than 180°, subtract it from 360° to obtain the smaller angle between the two meridians.

3. Find the difference of latitude (Δφ) between the two places by subtracting the smaller latitude from the larger.

4. Enter Table 1 with Δλ and Δφ to obtain the bearing and distance.

Notes: All west longitudes are taken as plus.

1. Find the algebraic difference of latitude (Δφ) by subtracting the smaller latitude from the larger.

2. If Δλ is greater than 180°, subtract it from 360° to obtain the smaller angle between the two meridians.

3. Find the mean latitude (φm) between the two places by adding the latitudes and dividing by 2.

4. Enter Table 1 with Δλ and φm to obtain the bearing and distance.

23 MARCH 1956

CONDITION OF TRIANGLES

Computation of the four triangles of an observed quadrangle is a required part of the field work to insure that it may be considered that the observed angles are within tolerances set up by the specifications. This is the first check on the accuracy of the observations to see that closures can be within prescribed limits and that meet the requirements of the next check.

In the quadrangle shown by the sketch the line MAX-CHARLIE is the base or known line. The expansion of the net is from the line ABLE-DOG as determined from this quadrangle. Two of the computations for the quadrangle are shown on the form which sets up the computation by precise logarithms.

The b_1 or strongest pair of triangles from which the line ABLE-DOG can be determined are entered first on the form in sections A and B, followed by the second best pair in sections C and D.

The individual triangles are always computed in a clockwise direction with (1) at the new station and (2) and (3) at the stations on the known line. The line 2-3 is always the known line.

Computations are completed to the following order with figures rounded off to the closest hundredth for first order and to the closest tenth for second order triangulation.

(a) Enter the names of the stations and the observed angles in columns 1 and 2 corresponding with the letters as printed on the individual triangles.

(b) The closing error of each triangle is distributed equally, or nearly so, between the three angles and entered in column 3 as plus angles which are determined by this operation to the nearest 0".1 that cancel total 180°. It should be noted that this distribution of the closing error of the individual triangles does not satisfy the normal laws of a quadrilateral adjustment but is of the best use in angle of a distribution may differ slightly from the normal angle size, this method is satisfactory for the size of and final balancing of the angles are accomplished by the side equation adjustment or in more precise computations by the method of least squares.

(d) To complete the first triangle (A) proceed logarithmically as follows, enter the logarithm of the base side (log, the middle) of the log sine of 1 and the log sines of 2 and 3 given in columns 5 and 6. The sum of the logarithms 2-3,1 and 2. Line 1-2 is the sum of the logarithms 3-1,2 and 3. From the logarithms of 1-2 and 1-3 determine the lengths of sides and enter in column 8. Complete the computation of triangles (B), (C) and (D) in a like manner.

(e) The spherical excess is computed from the formula $e = \sin 1'' \times A$ where a, b, and C are the two sides and included angle of the corresponding triangle. Three decimal places are sufficient in computing this quantity.

Obtain log A corresponding to the area in terms of the quadrangle from S.P.no.8 page 16. To log A add the log sides of the triangle from columns 8-3, 2 and 1-3 taken from column 7. The sum is the logarithm of the spherical excess which is to be entered in column 9 on the closing line over a equality, or nearly so, between the three angles. The excess divided by three gives the plane angles to be applied and entered in column 4.

Example — Triangle B

log A	1.402
log 3-1	3.306
log 3	9.820
log sum	4.128
log e	0.277 = 0.2"

The excess of 0.2" is distributed 0.1" each to two of the angles.

(e) The total correction to the observed angle is the difference between it and the spherical angle (column 4). The correction is plus or minus depending on whether the spherical angle is larger or smaller than the observed angle.

SIDE CHECKS. In the computation of a non-closed quadrangle there are always three lines which have two determinations of their length. One of the requirements of first order triangulation is that the difference between the two values for the logarithm of the length of a line be not greater than two times the log sine difference for one second of the smallest distance angle involved in the computation of either value. If less than this value is the allowance for second order triangulation.

Referring to the following completed form, the computation from

Line A, 1-3 — log sine 1" [illegible]
" B, 1-3 — log sine 1" [illegible]
Actual diff. — Allowance [illegible]

Line B, 1-3 — log sine 1" [illegible]
" C, 1-3 — log sine 1" [illegible]
Actual diff. — Allowance [illegible]

Line B, 1-3 — log sine 1" [illegible]
" D, 1-3 — log sine 1" [illegible]
Actual diff. — Allowance [illegible]

If this computation does not satisfy the conditions of the side check reobserving of one or more sections will be necessary. The most probable angles if required may generally be determined by inspection of the computations or by applying a little care on first check. When these conditions have been satisfied the quadrangle may be considered as meeting the requirements and no further check will be required at this time.

SURVEY DEPARTMENT

DESCRIPTION & RECOVERY

of

TRIANGULATION STATIONS

[illegible] 7 (2 / [illegible] section)

For establishment of a new station, two [illegible] preferably three reference marks would also be established. The [illegible] should be a 3/8" dia. brass, or other non-ferrous bolt marker, [illegible] as a bench mark. The station mark should be stamped with the name of the station, U.S.C.&G.S. and the year it is established. The reference point should be punch marked at near the center of the marker as possible. The station should be set in concrete in such a way that it cannot be easily disturbed. Local conditions should govern this however, the ideal monument would be a 12" x 12" reversed pyramid set in the coral reef underlying the island soil. The reference mark should be a non-ferrous metal with a surface large enough to stamp the following words: Bolt, [illegible] (2 or 3 min.) - the station name, U.S.C.&G.S. and the date of [illegible]. A 3/8" [illegible] brass marker is most desirable, but a large [illegible] bolt head here on ship would be also acceptable. This marker should be set in a concrete mound [illegible] so that the top of the station mark, or punch [illegible] mark. Should a road end back in either a concrete slab or the top of a [illegible] mound, a 3/8" [illegible] (such as a brass escutcheon pin) should be used and the head ground down to a point enough to stamp the required data on it.

When the station and its reference marks have been established, a complete description should be prepared containing the following items, viz:

(1) A physical description of the station area and the USC&GS building which type of marker was used, how it is marked, and how it is set (concrete, bolted into a ship, etc.).

(2) A sketch of the station location on the island to establish its [illegible] tide line, trees, and outstanding buildings or structures.

(3) A description of the route to the station from one of the reference marks from an [illegible] existing monument (preferably the control point station (Coral or Reference mark, Coast and [illegible]) or a prominent landmark whose coordinate location is known.

(4) The horizontal distance from the station mark to each of the reference marks and the azimuths between the reference marks.

(5) The elevations of the station mark and the reference marks. If no bench mark available to obtain the elevations, an elevation should be obtained from vertical observations and used for that purpose. If no bench mark exists, one will have to be used.

(6) A brief description of the instruments, equipment and methods used in making the measurements in paragraphs 3, 4 and 5.

Where at all practical the station mark should be witnessed with a triangular wooden barricade and the reference marks by a painted X on a post or tree near and away from the station mark.

RECOVERY OF AN EXISTING CONTROL

The purpose of station recovery is to determine correctly the suitability of an existing triangulation station control point for horizontal and vertical location already available without additional field work and to provide a check on any possible future loss or change in the station which would render it useless without further field work.

All previous recovery notes for station described should be made available to the person making the recovery to insure a full and complete recovery of the station.

When the station has been found with the mark or its corresponding to the data required in the preceding section, the following should be obtained. This data should be obtained by as near the same method and using as near the same methods and equipment as was used in the latest station description or survey. These values should be recorded on a Horizontal Control, Triangulation, Station form which is very similar to the "Description of Triangulation Station" form. Any differences in measured values from previous values should be checked and, if found to be actual changes, should be noted. Any changes in the features of the location which might cause trouble in recovering the station should be noted.

the recovery note and a sketch of the location plotted in context to the sketch required for the Station Description should also be added to the recovery.

In the event a station or reference mark has been disturbed or damaged in any way, no attempt to correct this should be made by the initial recovery pleader. Instructions for correcting, changing, supplementing, etc. will be issued by the Survey Office after examination of the initial recovery note from the field. When instructions or changes, supplements, etc. are issued, they will be issued in conformity with N. O. No. 5, Paragraphs as published in S. P. #247, modified to fit details accordingly.

FIELD BOOKS

Survey Generally

1. A record must be made of all field survey work in a duplicating Field Book. There are no exceptions. On projects, such as, plane table work, in which the actual work performed is not entered in the Field Book, a Field Book entry must be prepared as outlined in Paragraphs 9 and 11. The data not recorded in a Field Book must show the same information as the Field Book entry.

2. Two Field Books will be carried by each Party Chief. One book will be used for all Domestic (non-scientific) work, the other for Scientific work.

3. In Scientific work, Stations are referred to by number (i.e. not as shot tower, detector, etc.).

4. In Domestic work, all Buildings are referred to by number (i.e. not as mess-hall, water tower, etc.).

5. In both Domestic and Scientific work it is extremely important to show elevations of structures. Unless specifically directed otherwise, this should be in relation to the site datum. The notes must include all the details of the work.

6. Angles turned must show actual details, such as, initial, double or six, and mean. Generally, no pre-planned angles will be shown. Should it be desirable to show pre-planned angles, they should be clearly labeled as such.

7. Distances measured must show actual details, such as, forward and back measurements, eccentricity, such as, stadia, tying, balance, etc.

8. Sketches are used to clarify the work performed. When deciding whether one is necessary, remember that the notes will be processed and used by others not as familiar with the circumstances as you may be. Label all points shown and use a north arrow.

9. The first line of the left hand page must show the specific location and type of work. Examples: Building 20A, Reference Layout; Station 120, W.P. location; Warehouse Area, Topography; Bench 100, Levels. On the second line show the site by its current code name, such as, Site Elmer. For work located near a site name (Building, Reef, etc.), such as, "The Elmer Reef; Sites Elmer-Fred Line".

10. When continuous pages in the same Field Book are used, it is not necessary to repeat the title between the halves of the first right hand page used must show "continued on page _____". On following pages, each one must show "continued from page _____" at the top and "continued on page _____" at the bottom of the right hand page. The bottom of the last page used shall show "End of survey". If the right hand pages used are not in sequence in the Field Book or are in different books, the title shall appear on each page.

11. The first line on the right half of the right hand page is used for the date and general [illegible] succeeding lines for the names of the party, state of the weather and the time of starting and stopping work.

12. An index shall be kept on the first page of the Field Book, in the following manner:

PAGE	DESCRIPTION	SITE
[illegible]	Station 340, N. E. Cor. Tract	Ruby
[illegible]	Station 302, Angle	Ruby

13. Field Book originals must be turned promptly in the Survey Office.

14. ALL FIELD NOTES ARE TO BE MADE IN INK. THERE ARE NO EXCEPTIONS.

M. F. Curran jr
16 August 1956

FIELD NOTE [illegible]

Field Note original pages (white sheets) are indexed immediately after arriving at the office. They are then thoroughly checked for accuracy and completeness. If the checker finds them unsatisfactory, he returns them to the Chief of Party with a note attached stating the details in question.

When the Field Note originals have been checked and found satisfactory, the checker turns them over to the Department Head. The latter assigns them to a computer or draftsman for necessary action, such as, preparing tabulations, drawings, etc. After all necessary action has been taken, the Field Note originals are filed in the binder labeled with the Field Book number corresponding to that of the Field Notes. At this time a note is made on the Field Note pages in red pencil stating what action was taken.

If no one is available to take the necessary action, the Department Head makes an entry in a pending file. This file is reviewed daily.

When the Chief of Party has used all of the pages in a Field Book from 2 to 30 inclusive, he turns in the Field Book Index kept on Page 1. The Field Book originals are checked and the Chief of Party called to account for any missing pages.

The Index of Field Books consists of 3 x 5 inch cards kept in a standard metal file box. A Domestic and a Scientific file is kept for each Atoll. These are subdivided as follows:

DOMESTIC

SITE

Buildings	Numerical order
Roads	Alphabetical order
Sewers	Alphabetical order
Water Lines Electrical (Underground) Electrical (Overhead)	Alphabetical order of sheets of Site Plan
Topography	Separately when not directly related to any of above subdivisions
Hydrography	Separately when not directly related to any of above subdivisions
Marine Facilities	Numerical when facility does not have a building number
Horizontal Control	Numerical order
Vertical Control	Numerical order

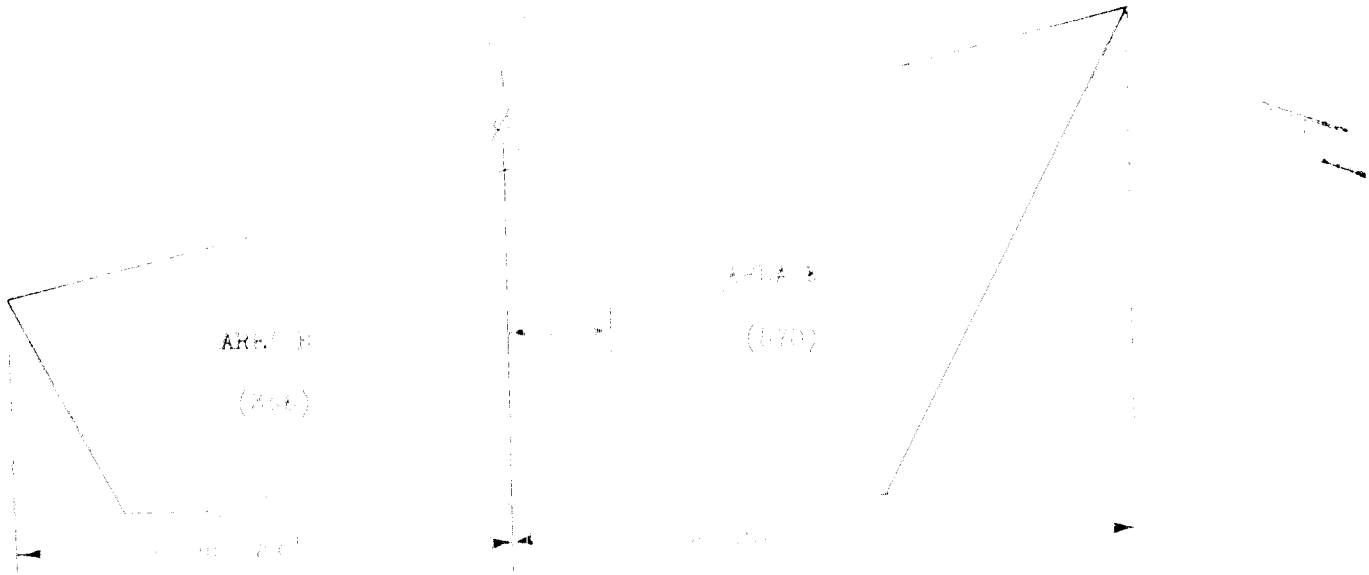
Bisect line "W" on center of gravity ( )
is 1/3 the distance from this point

Eccentricity of the section is the distance
the center of gravity to centerline.



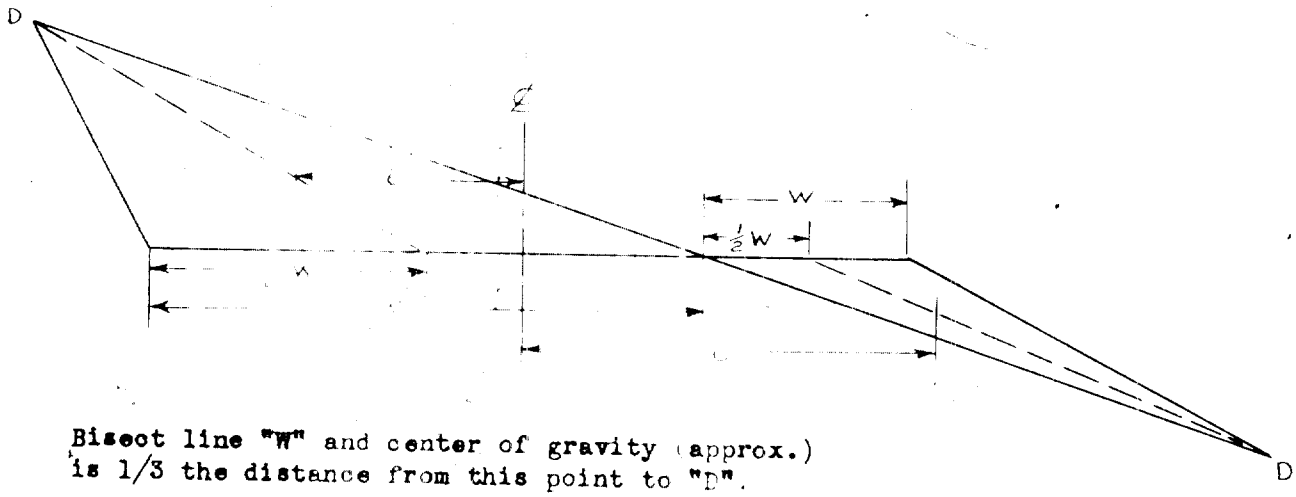
$$e = \frac{M \cdot S}{3I} \quad (\quad)$$

$$= \frac{\quad}{\quad} \times 12 = \quad \text{in.}$$

Determine area of sections each side of the centerline.
Scale the distance from centerline to top of one or each
side and apply the formula.

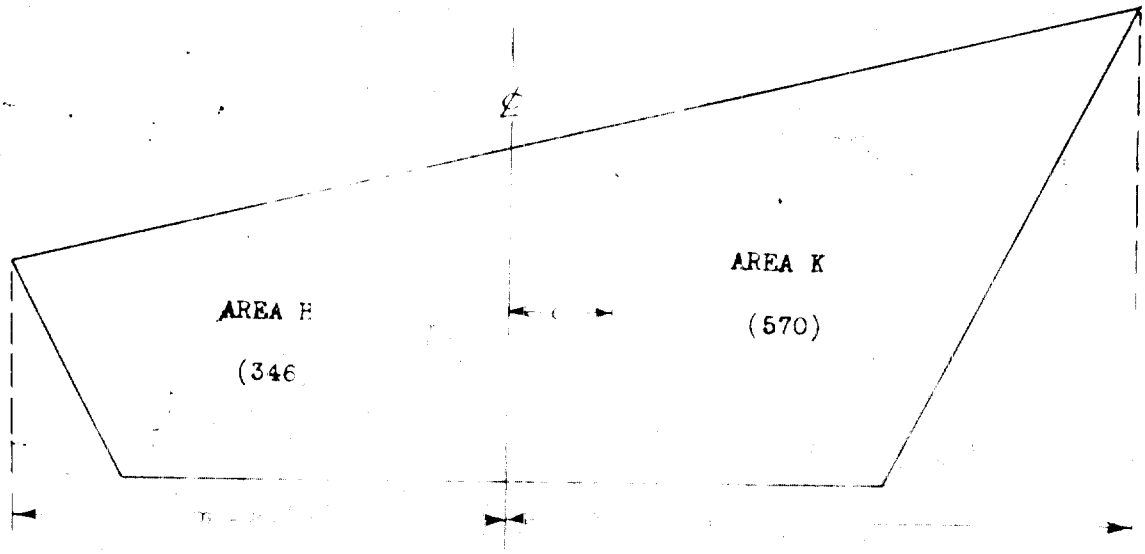
COMPENSATION FOR CURVATURE - [illegible] CARLAGE CALCULATIONS

ECCENTRICITY OF CENTER OF GRAVITY OF SECTION



Bisect line "W" and center of gravity (approx.) is 1/3 the distance from this point to "D".

Eccentricity of the section is the distance from the center of gravity to centerline.



$$e = \frac{n+m}{3A}(K-E)$$

E = 346
K = 570
Sum [illegible] Diff. = 224

$$e = \frac{69}{2448} \times 2.4 \text{ [illegible]}$$

Determine area of sections each side of the centerline. Scale the distance from center line to [illegible] of cut on each side and apply the formula.

CHORD AND DEFLECTION TABLE FOR CURVES OF STANDARD RADII

DEFL FOR 1' OF ARC = $\frac{1718.8733}{R}$

CHORD = 2R X SIN (DEFL FOR 1 ARC LENGTH)

RADIUS	LENGTH OF ARC	DEFLECTION FOR ONE ARC LENGTH	CHORD	DEFLECTION FOR A ONE FOOT ARC
[illegible]	[illegible]	[illegible]	24.384	22.91831'
100	[illegible]	[illegible]	24.385	17.18873'
125	[illegible]	[illegible]	24.388	13.75009'
